# 1 VISY-Command with Modbus

## Modbus Protocol Variants

VISY-Command with Modbus protocol supports the Modbus ASCII, RTU and TCP variant as described in the Modicon Modbus Protocol Reference Guide.

## Wiring Connections

The communication lines of the Modbus Master must be wired to the Host Interface of the VISY-Command. The Host Interface supports a RS-232 or a RS-485 connection. For further details about the connection to the Host Interface of the VISY-Command see following technical documentation:

VISY-Command VI-4, art. no. 207184.

# 2 Configuration

The configuration of the VISY-Command (e.g. the configuration of tanks) is done with the configuration tool "VISY-Setup" that runs on a computer.

## 2.1 Host Interface

To use Modbus as data protocol for the VISY-Command Host Interface select one of the following host codes using VISY-Setup:

123 - Modbus ASCII

124 - Modbus RTU

125 - Modbus TCP

## 2.2 Communication Parameters

The communication parameters can be changed to the required values using VISY-Setup. The following communication parameters are supported (default settings are marked in bold):

Baud rate: 300, 600, 1200, 4800, **9600**, 14400, 19200, 28800

Data bits: 7, **8**

Parity: **none**, odd, even

Stop bits: **1**, 2

## 2.3 Response Time

The response time varies depending of the Modbus variant that has been selected.

Modbus ASCII: 500 to 600 msec

Modbus RTU: 100 to 200 msec

Modbus TCP: 100 to 200 msec

## 2.4 Modbus Slave Addresses

The VISY-Command reserves 16 Modbus slave addresses so that there is one slave address for each possible tank. The base address (slave address of tank 1) can be configured in the range of 1 to 99 using VISY-Setup. Changing the base address also changes the slave addresses of tanks 2 to 16. Change the base address (Communication Address of Control Unit) to the required address using VISY-Setup. Tank slave address = base address - 1 + tank number of control unit VISY-Command (e.g. basis address = 17 and tank number = 5 -> Modbus slave address of tank = 21). To configure the base address, change the Communication Address of Control Unit with VISY-Setup. The default base address is 1. If several VISY-Command units are connected to a RS-485 Modbus network then useful base addresses are 1, 17, 33, 49, 65, 81 and 97. This allows for up to 112 Tanks with the slave addresses 1 to 112 on one single RS-485 Modbus network.

 *If the Communication Address of Control Unit is set to 0 then the communication is disabled, and the VISY-Command will not answer.*

# 3 Modbus Register Map

## 3.1 Function Codes

The following function codes are supported:

- Function Code 03 - Read Holding Registers
- Function Code 04 - Read Input Registers
- Function Code 08 - Diagnostics (only sub-function 00 - Return Query Data)

 *All registers are read only.*

## 3.2 Output formats

The following output formats are supported:

### 16-bit unsigned integer

- Big Endian (most significant byte first): [12]
- Little Endian (least significant byte first): [21]

### 32-bit floating-point

- Big Endian (straight word order, most significant byte first): [12] [34]
- Big Endian Bytes Swapped (straight word order, least significant byte first): [21] [43]
- Little Endian (inverse word order, least significant byte first): [43] [21]
- Little Endian Bytes Swapped (inverse word order, most significant byte first): [34] [12]

All values are available in the supported output formats. Different register areas are used for presenting the different output formats.

### 3.3 System of units

The following measurement units are supported:

- Metric: mm, l, °C, kg, kg/l, bar
- US: inch, gal, °F, lb, lb/ft<sup>3</sup>, psi

All measurement values are available in the supported measurement units.

Different register areas are used for presenting the different measurement units.

### 3.4 Values formatted in 16-bit unsigned format

The values formatted in 16-bit unsigned format can be read out using the following two Function Codes:

- Function Code 03 - Read Holding Registers
- Function Code 04 - Read Input Registers

You have to add 30001 or 40001 to the address shown in the table to get the register number. Please take into account that the addresses shown in the table have a hexadecimal format while the register numbers have a decimal format.

16-bit Unsigned Integer, General Information, Status, Alarms, no Units		
Address		Description
Format [12]	Format [21]	
0x0000	0x0100	Serial number (upper digits)
0x0001	0x0101	Serial number (lower digits)
0x0002	0x0102	Probe type
0x0003	0x0103	Protocol version
0x0004	0x0104	Number of discrete temperature sensors
0x0005	0x0105	Number of density modules
0x0006	0x0106	Status of probe
0x0007	0x0107	Status of tank
0x0008	0x0108	Age of data
0x0009	0x0109	Product alarm
0x000A	0x010A	Water alarm
0x000B	0x010B	Product density alarm
0x000C	0x010C	Sump density alarm
0x000D to 0x001F	0x010D to 0x011F	Free for future expansions (value is 0)

## Values

### Probe type

- 1 = Basic
- 2 = Standard
- 3 = Advanced

### Number of discrete temperature sensors

The number of discrete temperature sensors depends on the probe type.

### Number of density modules

The number of density modules mounted on the probe. The probe can handle up to 2 density modules.

### Status of probe

The probe can be in one of the following states:

- 0 - probe ok
- 1 - probe reports internal error
- 5 - probe reports temperature measuring error
- 6 - probe reports level measuring error
- 7 - probe reports reduced measuring accuracy
- 8 - wireless receiver reports checksum error in probe data received from transmitter (in wireless operation mode only)
- 9 - wireless transmitter reports missing probe response (in wireless operation mode only)
- 10 - communication error between VISY-Command and probe
- 11 - no response from probe or wireless transmitter
- 12 - incompatible probe data (communication and checksum ok but probe data does not match)
- 13 - waiting for first incoming data (after power-on or reset)
- 99 - probe not configured

### Status of tank

The tank can be in one of the following states:

- 0 - no delivery in progress and no waves on product surface
- 1 - delivery in progress or waves on product surface

### Age of data

Number of seconds that have passed by since the last update of the measurement data.

### Product alarm

The following product alarms are defined:

- 0 - no alarm
- 1 - very low alarm
- 2 - low alarm
- 3 - high alarm
- 4 - very high alarm

### Water alarm

The following water alarms are defined:

- 0 - no alarm
- 1 - high alarm
- 2 - very high alarm

### Product density alarm

The following product density alarms are defined:

- 0 - no alarm
- 2 - low alarm
- 3 - high Alarm

### Sump density alarm

The following sump density alarms are defined:

- 0 - no alarm
- 2 - low alarm
- 3 - high Alarm

### 3.5 Values formatted in 32-bit floating-point format

The values formatted according to the IEEE 754 single-precision 32-bit floating-point format can be read out using the following two Function Codes:

- Function Code 03 - Read Holding Registers
- Function Code 04 - Read Input Registers

You have to add 30001 or 40001 to the address shown in the table to get the register number. Please take into account that the addresses shown in the table have a hexadecimal format while the register numbers have a decimal format.

Two consecutive 16-bit registers have to be read to get the complete 32-bit floating-point value.

If a requested 32-bit floating-point value is either not supported or the probe has an error the returned value will be 0.

#### 3.5.1 Metric Units

32-Bit Floating-point, Configuration Data, Metric Units (mm, l, °C)				
Address				Description
Format [12][34]	Format [21][43]	Format [43][21]	Format [34][12]	
0x0020	0x0120	0x0220	0x0320	Tank capacity
0x0021	0x0121	0x0221	0x0321	
0x0022	0x0122	0x0222	0x0322	Tank maximum permissible volume
0x0023	0x0123	0x0223	0x0323	
0x0024	0x0124	0x0224	0x0324	Tank diameter / Tank height
0x0025	0x0125	0x0225	0x0325	
0x0026	0x0126	0x0226	0x0326	Reference temperature
0x0027	0x0127	0x0227	0x0327	
0x0028	0x0128	0x0228	0x0328	Position of product density module <sup>1)</sup>
0x0029	0x0129	0x0229	0x0329	
0x002A	0x012A	0x022A	0x032A	Position of sump density module <sup>2)</sup>

0x044C to 0x044F	0x054C to 0x054F	0x064C to 0x064F	0x074C to 0x074F	Free for future expansions (value is 0.0)

<sup>1)</sup> Only available if the probe is equipped with a product density module.

<sup>2)</sup> Only available if the probe is equipped with a sump density module.

<sup>3)</sup> A value of 100 % for the percentage of product level equates to the tank diameter of a horizontal tank or the tank height for a vertical tank.

<sup>4)</sup> A value of 100 % for the percentage of volume equates to the tank capacity.

0x0476	0x0576	0x0676	0x0776	Liquid equivalent volume of LPG in the vapour phase <sup>1)</sup>
0x0477	0x0577	0x0677	0x0777	
0x0478	0x0578	0x0678	0x0778	Pressure of LPG <sup>2)</sup>
0x0479	0x0579	0x0679	0x0779	
<hr/>				
0x047A to 0x047F	0x057A to 0x057F	0x067A to 0x067F	0x077A to 0x077F	Free for future expansions (value is 0.0)

<sup>1)</sup> Only available if the product of the tank is LPG.

<sup>2)</sup> Only available if the LPG tank is equipped with a pressure sensor of type VPS-L.

### 3.6 Exception Codes

The following exception codes are supported:

- 01 - Illegal Function
- 02 - Illegal Data Address
- 03 - Illegal Data Value

#### 01 - Illegal Function

The exception code Illegal Function is returned under the following circumstances:

- A function code other than 03, 04 or 08 is used.
- The function code 08 is used with a sub-function code other than 0000.

#### 02 - Illegal Data Address

The exception code Illegal Data Address is returned under the following circumstances:

- The function code 03 or 04 is used with a starting address that is not included in the VISY-Command Modbus register map.

- The function code 03 or 04 is used with a correct starting address but the number of registers requested results in an address that is not included in the VISY-Command Modbus register map.

### 03 - Illegal Data Value

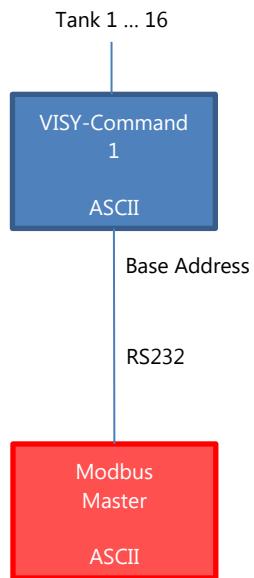

The exception code Illegal Data Value is returned under the following circumstances:

- The function code 03 or 04 is used and the number of registers requested is either 0 or higher than 112.

## 4 Connection Diagrams

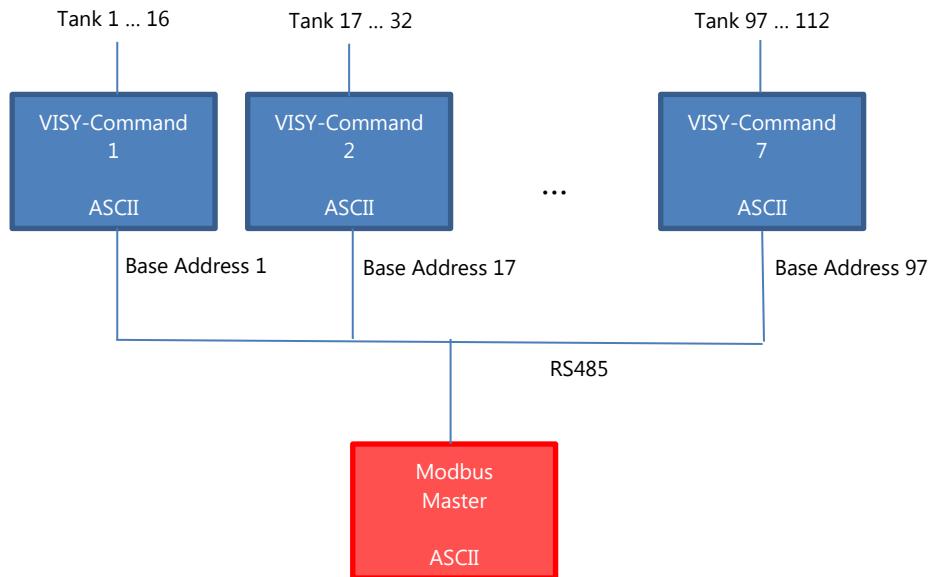

### 4.1 Modbus ASCII (Host Code 123) via RS232

RS232 point to point connection between one single VISY-Command (Modbus ASCII Slave) and one single Modbus ASCII Master.

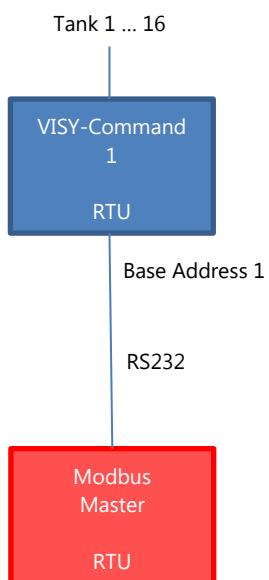

## 4.2 Modbus ASCII (Host Code 123) via RS485

Several VISY-Commands (Modbus ASCII Slaves) on one RS485 network connected to one single Modbus ASCII Master.

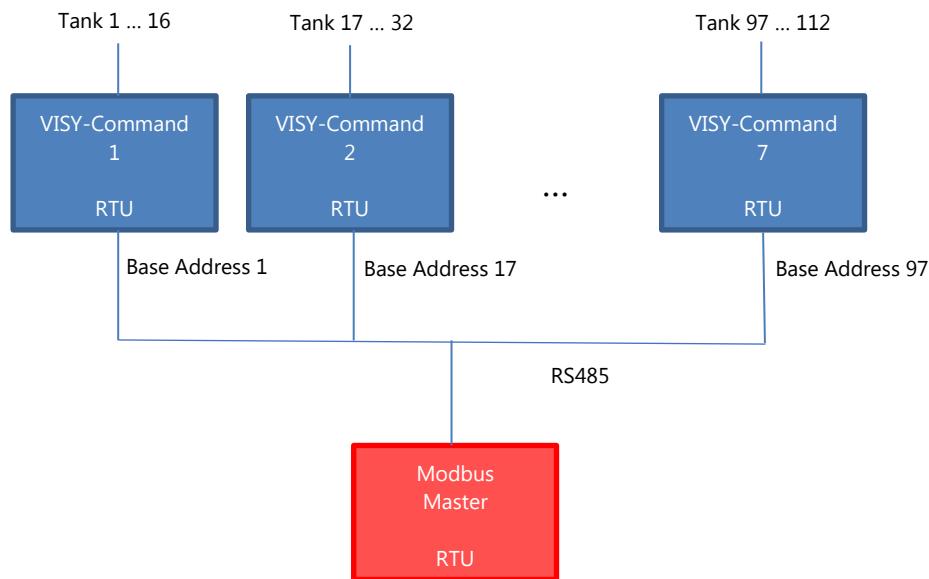

## 4.3 Modbus RTU (Host Code 124) via RS232

RS232 point to point connection between one single VISY-Command (Modbus RTU Slave) and one single Modbus RTU Master.

#### 4.4 Modbus RTU (Host Code 124) via RS485

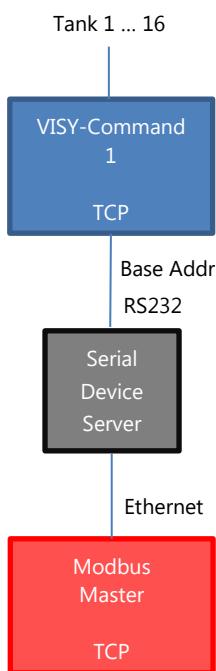

Several VISY-Commands (Modbus RTU Slaves) on one RS485 network connected to one single Modbus RTU Master.

#### 4.5 Modbus TCP (Host Code 125)

TCP point to point connection between one single VISY-Command (Modbus TCP Slave) and one single Modbus TCP Master.

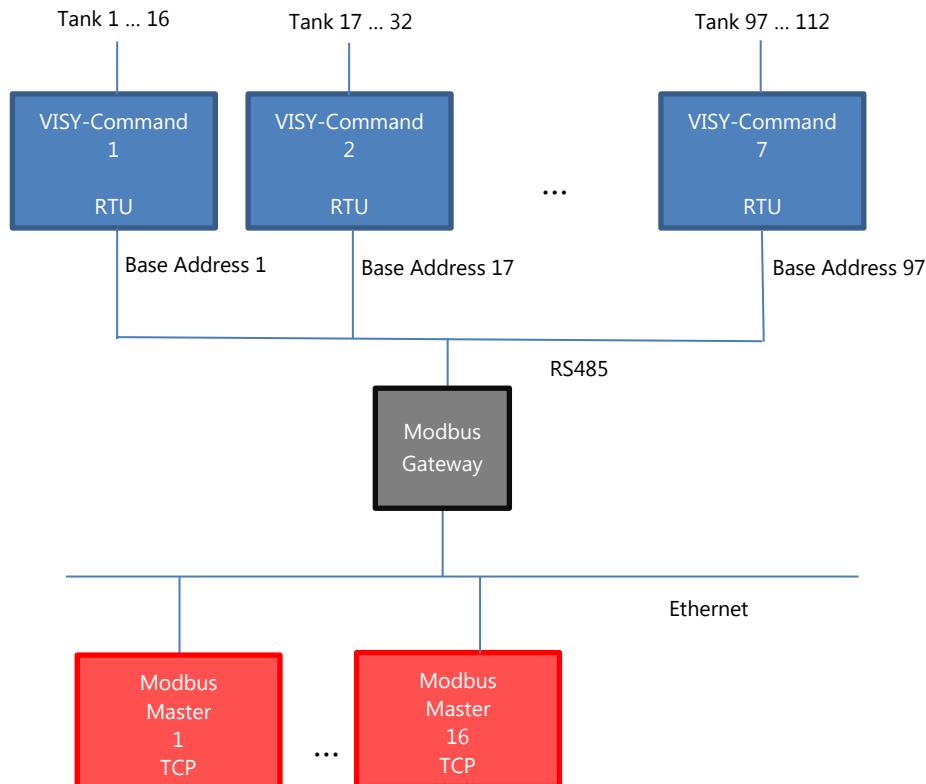

An additional serial device server has to be connected to the VISY-Command host port. The serial device server can be obtained from FAFNIR.

## 4.6 Modbus RTU (Host Code 124) to Modbus TCP via Modbus Gateway

Several VISY-Commands (Modbus RTU Slaves) on one RS485 network can be connected to several Modbus TCP Masters.

An additional Modbus Gateway is required.
