1 Introduction

The VISY-X system (Volume Information SYstem) provides highly precise and continuous filling level measurement for all commercially available fuels. The VPI Interface (VISY Power Interface) enables a filling level measurement in up to 256 tanks with a maximum of 32 VPIs. The product temperature and water level are measured simultaneously and the density can also be measured as an option.

The system includes:

- the VPI as a communication interface between the sensors and a higher-level system (host)
- the FAFNIR VPI power supply (Art. no. 908315). As an option, an independent power supply can also be used, see chapter 3.4
- the VISY-Stick and/or VISY-Reed sensors
- as an option, the VIMS sensors from our system partner SGB (see chapter 1.1) can also be used.

The sensors are connected with the VPI which is mounted inside the petrol station building.

The VPI is a communication interface between the sensors and a higher-level system (host). Commands from the higher-level system to the sensors are allocated to the corresponding sensor terminals of the VPI. The feedback from the sensors is transmitted back to the higher-level system (host).

The VPI supports the following protocols:

- FAFNIR Universal Device Protocol (UDP)
- H-Protocol

In order to take advantage of all functions offered by the VISY-X system, the FAFNIR Universal Device Protocol must be used.
1.1 In this manual …

... you will be guided through the installation and set-up of the VPI interface. This manual contains a description of all steps needed to perform the installation. Please also observe the additional instructions in the following manuals:

- Technical Documentation VISY-Stick VISY-Reed (German) – Art. No. 207193
- Technical Documentation FAFNIR UDP (English) – Art. no. 350052

For the installation of the VIMS sensors, please also contact:

☞ SGB GmbH, Hofstraße 10, 57076 Siegen, Germany
   Tel.: +49 271 48964–0, Fax: +49 271 48964–6, e-mail: sgb@sgb.de

1.2 Requirements for service engineers

The complete VISY-X system should only be installed by trained service engineers.
1.3 Safety instructions

The VISY-X system is optimised for use in petrol stations and is compatible with all commercially available fuels. It serves to measure and evaluate the filling levels in tanks. The system must be used exclusively for this purpose. Please observe and follow all product safety notes and operating instructions. The manufacturer accepts no liability for any form of damage resulting from improper use.

The VPI interface has been developed, manufactured and tested in accordance with the latest good engineering practices and generally accepted safety standards. Nevertheless, hazards may arise from their use.

The following safety precautions must be observed in order to reduce the risk of injury, electric shocks, fire or damage to the equipment:

- Please do not make any changes to the system.
- The installation, operation and maintenance must only be carried out by expert personnel.
- Operators, installers and service technicians must observe all applicable safety regulations. This also applies to any local safety and accident prevention regulations which are not stated in this manual.
- During the installation process, valid national construction regulations must be observed.
- The VPI must not be installed in potentially explosive areas.
- The VPI must be in a clean and undamaged condition at all times.
- The VPI must only be powered by the permissible auxiliary power supply.

The safety instructions in this manual are marked as follows:

⚠️ If these safety instructions are not observed, it may result in the risk of accident or damage to the VISY-X system.

💡 Useful tips and information in this manual, you should observe, appear in italics and are identified by this symbol.
2 Design and function

The VPI is designed for the DIN mounting rail.

It has eight intrinsically safe sensor terminals. At each individual sensor terminal of the VPI, it is possible to connect up to three different types of FAFNIR sensors (e.g. one VISY-Stick, one VISY-Stick Interstitial and one VISY-Stick Sump). These three types of sensors can be directly connected to each other at the measuring point. This means that only one cable (4-wire) is required for connection to the VPI interface.

In combination with the VIMS sensors from our system partner for leakage control (SGB GmbH, Siegen), two FAFNIR sensors and two SGB sensors can be connected to the VPI using one single cable (4-wire).

Connecting multiple sensors of the same type (e.g. 3 x VISY-Stick) to one sensor terminal is not permitted.

The sensors are electrically supplied with power by the VPI. A 12 V direct current is necessary for the power supply of the VPI. The FAFNIR VPI-Supply (accessories) is safely galvanically isolated between the input and output and can supply up to two VPIs.

Alternatively, another power supply can be used. Therefore, a power consumption of 125 mA should be set for every VPI. The tolerance of the supply voltage must not exceed 5 %.

Depending on the number of sensors to be connected, up to 32 VPIs may be interconnected. Every VPI must hereby be assigned with its own address from 0 to 31 via a DIP switch.
3 Installation

⚠️ For the installation and operation of the interface VPI in Germany, the requirements of the Ordinance on Explosion Protection (ExVO), the Ordinance on Industrial Health and Safety (BetrSichV) and the equipment safety legislation must be observed (in other countries, equivalent local requirements and regulations must be observed). In all countries, valid and generally accepted good engineering practices as well as these operating instructions must be observed.

⚠️ Observe also the local safety and accident prevention regulations, which are not stated in these operating instructions.

⚠️ All wiring operations must be carried out with the power disconnected.

3.1 Assembly

⚠️ The VPI must be firmly connected inside a building to a mounting rail in a casing with a protection class of at least IP20.

👉 In casing with the corresponding protection class (at least IP54), the VPI is also suitable for outdoor installation.

3.2 Sensor connections

Connect the sensors to the sensor terminal clamps of the VPI (see Figure 1).

The connection cable of the sensors must have the following properties:

- 4-core unshielded, oil-resistant cable
- Line cross section (4 x 0.5 mm² up to 250 m or 4 x 1.0 mm² over 250 m)
- Colour blue or marked blue (cable for intrinsically safe power circuits)

⚠️ The maximum external inductance including the cable must not exceed 5 mH and the maximum capacitance must not exceed 610 nF (see data sheet of the cable used).
3.3 RS-485 interface connector

In order to connect to the higher-level system (host), the VPI has a RS-485 interface with a 4-pole header plug on the underside of the board. The interface does not have its own power supply and must be supplied with 5 V via the accompanying 4-pole connection cable.

Two transmission speeds are supported:

</tbody>
</table>
3.3.1 Programming interface
Concealed at the back of the printed circuit board is a programming interface through which an update of the VPI firmware can be carried out if necessary. For more information, please contact FAFNIR.

3.3.2 Configuration of the VPI address
Up to 32 VPIs can be interconnected for the connection of the sensors. Every VPI must be assigned with its own address from 0 to 31. The addresses are configured by the sum of powers of 2 with the DIP switch S1:

Table 1: DIP switch S1 for VPI address

3.4 Supply voltage connection
The supply with auxiliary power (electrical connection) takes place via a 2-pole header plug on the underside of the VPI. The respective 2-pole connection cable is included within the scope of supply.

A 12 V direct current is necessary for the power supply of the VPI. The FAFNIR VPI-Supply (art. no. 908315) is provided as an accessory. The VPI-Supply can supply up to two VPIs.

⚠️ A minimum distance of 50 mm (thread measure) should be ensured between the VPI and the VPI-Supply.

Alternatively, another power supply can be used. Therefore, a power consumption of 125 mA should be set for every VPI. The tolerance of the supply voltage must not exceed 5 %.

⚠️ If the FAFNIR VPI-Supply is not used for the power supply of the VPI, it is imperative that the sensors and the VPI are correctly integrated into the potential equalisation (PA).
3.5 Status LEDs

One green and two Red LEDs are on the VPI.
The green LED which is marked with "power", signals that the power supply is active and the VPI is ready for operation.
The red LED which is marked with "RS-485", signals incoming data from the higher-level system.
The red LED which is marked with "sensor", signals feedback from the sensors.

4 Technical Data

4.1 VPI

The terminals are numbered with the figures 1 ... 8 and the additions +, A, B and -. The intrinsically safe sensor circuits are safely galvanically isolated from the auxiliary power circuit for the use of a VPI-Supply up to a peak of 375 V of the nominal voltage.
The intrinsically safe sensor circuits are safely galvanically isolated from the control circuit up to a peak of 190 V of the nominal voltage.

(15) Description of equipment

The measuring transmitter VPI is used for the supply of intrinsically safe sensors which can be used in explosion hazardous areas. In addition, the measuring transmitter VPI is used for the transmission of electrical signals between the explosion hazardous area and non explosion hazardous area. Furthermore the measuring transmitter VPI is used as a module of a tank level measuring system. The measuring transmitter is made for a maximum of eight intrinsic safety channels.

For powering the measuring transmitter it can be used the power supply VPI-Supply. Also it can be used any other power supply under condition of safe use.

(16) Test documents are listed in the test report No. 11203388544.

(17) Special conditions for safe use

1. The potential equalization terminal (PA) on printed circuit board of the measuring transmitter VPI has to be connected with the potential compensation of the explosion hazardous location when the power supply VPI-Supply is not used.

2. The measuring transmitter VPI and the power supply VPI-Supply has to be installed in an enclosure with degree of protection according to EN 60529 of minimum IP20.

3. At installation of the measuring transmitter VPI with the power supply VPI-Supply the minimum clearance between these two has to be 50 mm (tight string length).

4. The permissible ambient temperature range of the measuring transmitter VPI and of the voltage supply VPI-Supply is -20 °C to +60 °C.

(18) Essential Health and Safety Requirements

no additional ones
7.3 Instructions

Measuring transducer VPI with or without power supply VPI-Supply

I Range of application

The associated equipment VPI and VPI-Supply may only be used outside the potentially explosive area. The voltage supply VPI-Supply serves as powering the VPI measuring transducer. The VPI measuring transducer is primarily used to supply electronic filling level sensors with power and forward the measured data to a superordinate evaluation system.

II Standards

See EC-Type Examination Certificate.

III Instructions for safe ...

III.a use

The associated equipment VPI has eight intrinsically safe sensor inputs. Each sensor is connected using four terminal clamps. Two clamps are provided for the intrinsically safe power supply whilst the other two are for the transmission of measurement data. At the same time, the VPI transducer is used to safely isolate intrinsically safe and non-intrinsically safe circuits. All sensor connections are galvanically connected to one another. The intrinsically safe sensor circuits of the VPI measuring transducer are safely galvanically isolated from the auxiliary power supply circuit up to a peak value of the nominal voltage of 375 V. The non-intrinsically safe control-circuit (RS485 interface) is linked to a 4-pole connector plug. This connector plug establishes the connection to a superordinate data-processing system. The intrinsically safe sensor circuits of the VPI measuring transducer are galvanically isolated from this measuring and control circuit up to a peak value of 190 V of the nominal voltage.

III.b assembling and dismantling

The VPI measuring transducer and the VPI-Supply must be installed in a housing with protection class of at least IP20. It is important to ensure that non-intrinsically safe wiring connections are located with a clearance of at least 50 mm (thread measure) from the VPI printed circuit board and the intrinsically safe sensor terminals. This for instance can be achieved using a suitable separation plate.

III.c installation

All wiring operations must be carried out with the power disconnected. The specific EN directives and local installation regulations including EN 60079-14 must be observed. The wiring from the sensor to the measuring transducer shall be carried out using a 4-wire cable (preferably blue). The terminals +, -, A and B of the sensor must be connected to the same terminals on the measuring transducer. If the VPI-Supply is not used to power the VPI measuring transducer, it is imperative that the sensors and the measuring transducers are integrated correctly into the potential equalisation (PA). The PA terminal is located in the middle of the VPI printed circuit board. All sensors must be securely connected with the PA terminal of the VPI measuring transducer. The specific construction regulations must be observed.

III.d putting into service

Before putting into service, all devices must be checked of right connection and fitting. The power supply, including that of downstream devices, must also be checked.

III.e maintenance, overhaul and repair

The device is maintenance-free. In case of a defect, please send the measuring transducer back to the manufacturer.

6. CE marking: 

V  Technical data

**VPI-Supply**

The auxiliary power supply of the VPI-Supply is connected to the terminals PE, N and L. Depending on the module version, the auxiliary power is:

\[
U = 24 V \text{ a.c.}, \quad 115 V \text{ a.c.} \text{ or } 230 V \text{ a.c.}; \quad \pm 10 \%; \quad 40 Hz \ldots 60 Hz, \quad ~4 VA.
\]

The maximum safety voltage is:

\[
U_m = 30 V \text{ at } 24 V \text{ a.c.}, \quad \text{or } 130 V \text{ at } 115 V \text{ a.c.}, \quad \text{or } 253 V \text{ at } 230 V \text{ a.c.}
\]

The output voltage is 12 V d.c. ± 5 %.

Two VPI measuring transducers can be connected to one VPI-Supply.

**VPI**

The auxiliary power supply for the VPI measuring transducer is connected to a plug underneath the module and is:

\[
U = 12 V \text{ d.c.} \pm 10 \%, \quad < 2 W.
\]

The maximum safety voltage is:

\[
U_m = 253 V.
\]

The sensor circuits are designed in ignition protection type “intrinsic safety” (ia) with a linear output characteristic. The output values are:

\[
\begin{align*}
U_o & \leq 10.5 V \\
I_o & \leq 41.0 mA \\
P_o & \leq 99.8 mW
\end{align*}
\]

Max. permissible external \quad IIC \quad IIB
\[
\begin{align*}
\text{Inductance } L_o & \leq 5 mH \quad \leq 2 mH \quad \leq 20 mH \quad \leq 10 mH \\
\text{Capacitance } C_o & \leq 610 nF \quad \leq 780 nF \quad \leq 2.5 \mu F \quad \leq 3 \mu F
\end{align*}
\]

The terminals are labelled with the numbers 1 ... 8 and the additions +, A, B and -. The intrinsically safe sensor circuits are galvanically isolated from the supply circuit safely up to a peak nominal voltage of 375 V. The intrinsically safe sensor circuits are safely galvanically isolated from the control circuit up to a peak of 190 V of the nominal voltage.
VI Specific conditions for use

1 If the voltage supply VPI-Supply is not used, the potential equalization terminal (PA) on the VPI module must be connected to the potential equalization in the explosive area.

2 The VPI measuring transducer and the power supply VPI-Supply must be installed in a housing with a degree of protection according to EN 60529 of at least IP20.

3 When installing the VPI measuring transducer with the power supply VPI-Supply, the minimum clearance between these two has to be 50 mm (tight string length).

4 The permissible ambient temperature range of the VPI measuring transducer and of the voltage supply VPI-Supply is -20 °C to +60 °C.
